

Schwieterman Market Outlook

A marketing commentary by Bret Crotts

Last week was filled with volatile, choppy action in the grain markets. Ideas that the forecasts were moderating and that Ukraine would be shipping large quantities of grain out of the Black Sea helped to put pressure on the markets. Nancy Pelosi's trip to Taiwan made traders worried about another trade war with China, or an invasion of Taiwan, that would disrupt world trade. It didn't help that crop condition ratings were better than expected with the corn unchanged at 61% Good to Excellent and the soybeans up 1 point at 60% Good to Excellent and that crude oil spent the

week under pressure. Things took a turn for the better last Thursday,

partly because the forecasts really don't look that great, and since it has been a dry week in the western Corn Belt, there is a good chance that crop condition ratings decline. It also helped that traders began to realize that it is still going to be very difficult to ship large quantities of grain out of Ukraine. and Pelosi's trip to Taiwan didn't start another war, so everyone is more relaxed about that.

On the charts, the December corn is hinting at making an unusual July low. The market needs to at least clear the July 29th high of \$6.36 ½, and it would be better to clear the July 11th high of \$6.58 ½, in order to confirm a long-term low. It will all depend on the weather, and how traders react to the August supply and demand report that comes out the 12th. There is the potential for numerous changes, including adjustments to both acreage and yield, as well as all the demand estimates.

Wheat is still stuck in a sideways pattern. We see some signs of strength every now and then, but it doesn't last long. Last week's export sales numbers weren't great, but that is the exception and not the rule. However, we will need to see better demand to encourage speculative buying because there are still fears of shortages. If we don't see big exports, we are going to have to see consistent gains in the

corn to force wheat into the feed rations. Until we see a close above \$9.21 ½ in the December KW, there isn't much reason to do anything besides trade the range in the wheat market.

Last Thursday's jump in the beans was encouraging, but the failure to build on those gains Friday won't give the bulls any confidence. The November soybeans really need to take out the July 29th high of \$14.89 to put the bulls in control. That is definitely possible with the right combination of weather, demand, and USDA report numbers. It just doesn't take much to turn the soybean fundamentals from friendly to extremely bullish, so it could be very volatile again this week.

The cattle futures had a good week. We saw numerous multi-month highs in the live cattle and solid gains in the feeders. Deferred live cattle continue to benefit from long term optimism that is created in part by the extremely high cow and heifer slaughter. Grass & Grain, August 9, 2022 It is going to be hard to build back the cow herd, so fed cattle numbers, and beef production are likely to be lower in 2023. Several of the 2023 contracts made new highs last week and it is likely that the February and April will do the same very soon. *Grass & Grain, August 9, 2022 nication, are an ex ing decisi ning decisi nication, are an ex ing decisi nication,*

We can probably plan on new contract highs in the October feeders as well, especially if the corn struggles at all. If the 2023 live cattle contracts keep making new highs, the feeders won't be held back for long.

ServiTech makes recommendations regarding drought conditions

Areas of the country are in a severe drought, with conditions so extreme some growers are taking their soil conditions day by day. ServiTech, the nation's leading independent crop consulting and agriculture lab, is making a prediction growers should lean in to hear.

In a cyclical pattern that comes with extreme drought, ServiTech expects to work with its grower customers to manage a uniquely high level of nitrates in the soil as well as potentially lower pH levels.

ServiTech's Senior Lab Agronomist Fred Vocasek said it may be to a grower's advantage to help blunt the effects of severely dry conditions with zone-specific soil tests to help make nitrogen management decisions.

"Drought conditions have been present for an extended time in many areas and with that drought comes a cyclical effect to soil microbial activity," Vocasek said. "Optimum soil temperature is between 60 and 95 degrees for microbial activity. When we accumulate more heat units faster and for a longer time, which is what happens during drought, microbes in the soil work longer and harder to decompose organic matter. This results in more nitrate accumulation."

Vocasek says in 2011, a record-setting year for agriculture, the drought line broke at Interstate 70 in Kansas and Colorado. ServiTech compared the soil test nitrates received that summer, south versus north of I-70 in the area including the panhandles of Oklahoma, western Kansas and eastern Colorado.

"The droughted area to the south had soil test nitrate levels roughly double those of the northern part of this area," Vocasek says. "Soil nitrate tests showed about 15 to 25 pounds of nitrogen per acre more in the droughted southern area than the northern area. That's easily worth \$10 to \$15 per acre as nitrogen fertilizer. Fifteen bucks, an acre's worth of nitrogen, will pay for a soil test, so the ROI is a lot better than Wall Street."

Vocasek said a lack of rain also keeps nitrate from being moved into the subsoil, which means surface nitrate accumulations may be higher than normal. Accumulations of 50 to 100 pounds of nitrate per acre may not be unusual even in dryland fields that did not receive fertilizer nitrogen.

Since 1975, ServiTech has worked with customers to test their soil and hone in on variability between zones in the field. The company has shared a message of high soil nitrate levels due to drought in the past and growers should realize the soil test numbers are real and dependable. This season, nitrate variability across drought stressed fields may be more than expected, so soil sample sampling smaller zones can help make solid nutrient management decisions.

While elevated soil nitrates during extreme drought aren't unusual, Vocasek said that ServiTech agronomists have often noted lower soil pH values. Soil pH can be as much as 0.4 to 0.5 units lower after a season of prolonged drought compared to years with normal rainfall.

"The drought of 2011 set records in many areas where depression of soil test pH was common," Vocasek said. "Soil tests often return to more normal levels when rainfall resumes, so growers shouldn't panic. ServiTech offers a Sikora-2 method for measuring soil pH, which can more accurately reflect soil pH in sandy and drought-affected soils."

Vocasek said the key is for growers to make sure they

are tracking soil pH to see if soil acidity is increasing, which is a potential problem for wheat in areas that have not been affected in the past.

"In summer 2011, there were places in west Texas where soil pH was 0.7 to 0.8 units lower than normal," Vocasek said. "The depression of soil pH is due to natural changes occurring as soil dries down during long-term drought."

Grass & Grain, August 9, 2022

Page 14

Kansas Hay Market Report

Compared to the last report, prices for alfalfa and grass hay bumped up again for all regions. Pricing remains all over the map and not much has settled in yet with a wide variance between east (rain) and west (no rain). Demand is high and is coming from in state and out of state buyers, as western Kansas and surrounding states drought conditions continue to worsen. According to the U.S. Drought Monitor for July 26th, abnormally dry conditions (D0) decreased to 13%, moderate drought (D1) increased to 23%, severe drought (D2) increased to 20%, extreme drought (D3) decreased to 17%, and exceptional drought (D4) increased to near 8%. Join agriculture leaders from across the state for the Kansas Governors Summit on Agricultural Growth August 17th and 18th. More information about the Summit and registration, including the Feed and Forage breakout session on August 11th, go to www.agriculture.ks.gov/Summit.

** Prices below reflect the average price. There could be prices higher and lower than those published. Southwest Kansas

Dairy alfalfa steady to .05/point higher, grinding alfalfa, and ground and delivered steady, movement slow. Alfalfa: horse, supreme small squares new crop 12.00/ bale. and dairies, 225.00-235.00, with an instance at 250.00-260.00; Grass Hay: Bluestem, large rounds 125.00-135.00 delivered, large 3x4's 150.00-170.00 delivered. The week of 07/24-07/30, 7,038T of grinding alfalfa and 700T of dairy alfalfa was reported bought or sold.

South Central Kansas

Dairy alfalfa steady to .05/point higher, grinding alfalfa, steady, ground and delivered steady to 5.00 higher, alfalfa pellets, steady, movement slow to moderate. Alfalfa: horse, small squares 255.00-275.00. Dairy 1.15-1.20/ point RFV, Supreme (185rfv - 200rfv) 210.00- 240.00, Premium (175rfv - 185rfv) 200.00-220.00, Good (150rfv - 170rfv) 175.00-215.00. Good, Stock cow, new crop 215.00-230.00. Fair/good grinding alfalfa, new crop large rounds 185.00-205.00 delivered, 3x4 and 4x4's 215.00-230.00. Ground and delivered 210.00-220.00 with an instance at 230.00-240.00. New crop 215.00-230.00. Alfalfa pellets: Sun cured 15 pct protein 245.00-265.00, 17 pct protein 250.00-270.00, Dehydrated 17 pct 310.00-315.00. Grass Hay: Bluestem, large squares 3x4's, old crop 110.00-125.00. Bluestem: large rounds 100.00-105.00, 3x4's 120.00-130.00, small squares 160.00-170.00. Brome: small squares, 9.00/bale, large rounds 135.00-140.00, 3x4's 140.00-150.00. Sudan: large rounds 160.00-170.00. Oat straw: 80.00-90.00. Wheat straw: 95.00-105.00. The week of 07/24-07/30, 8,455.5T of grinding alfalfa and 702T of dairy alfalfa was reported bought or sold.

Southeast Kansas

Dairy alfalfa steady to .05/point higher, grinding alfalfa steady to 10.00 higher, grass hay steady 5.00 higher, movement slow. Alfalfa: horse or goat, 260.00-270.00. Dairy 1.10-1.20/point RFV. Good, stock cow 200.00-225.00. Fair grinding alfalfa, 160.00-180.00; Grass hay: Bluestem, small squares 130.00-140.00, large round 80.00-95.00, good 3x4 squares 120.00-135.00. Brome, large rounds 140.00-150.00, 3x4 and 4x4 squares 150.00-170.00. The week of 07/17-07/23, 1,378T of grass hay was reported bought or sold.

Northwest Kansas

Dairy alfalfa steady to .05/pt higher, grinding alfalfa steady to 10.00 higher, stock cow steady, movement slow. Alfalfa: Horse or goat, small squares 300.00-400.00

delivered, 3x4 squares 250.00-260.00. Dairy, Premium/ Supreme 1.15-1.20/point RFV. Stock cow, fair/good 195.00-205.00. Fair/good grinding alfalfa, 195.00-205.00 picked up out of the field.

North Central-Northeast Kansas

Dairy alfalfa steady to .05/pt higher, grinding alfalfa, ground/delivered and grass hay steady, movement moderate. Alfalfa: horse, premium small squares, 11.50-12.50/ bale. Dairy 1.15-1.20/point RFV, Supreme (185rfv - 200rfv) 210.00-240.00, Premium (175rfv - 185rfv) 200.00-220.00, Good (150rfv-170rfv) 175.00-215.00. Stock Cow 200.00-210.00. Fair/good, grinding alfalfa new crop 195.00-205.00, new crop large square 3x4's 205.00-235.00; Ground and delivered, old contracts 175.00-190.00, Grass hay: Bluestem, small squares 8.00-9.00/bale, large 3x4 squares 130.00-140.00, 3x3 squares 100.00-110.00, good large rounds old crop 85.00-100.00, Brome: small squares 8.50-9.00/bale, new crop large rounds 145.00-155.00; Oat straw: large rounds 85.00-95.00. Wheat straw: small squares 6.00/bale, large rounds 90.00-100.00, large squares 85.00-100.00. The week of 07/17-07/23, 2,946T of grinding alfalfa and 213.5T of dairy alfalfa was reported bought or sold.

***Prices are dollars per ton and FOB unless otherwise noted. Dairy alfalfa prices are for mid and large squares unless otherwise noted. Horse hay is in small squares unless otherwise noted. Prices are from the most recent sales.

Zoetis receives expanded labels for beef implant products

Zoetis announced it has received expanded label approval from the Food and Drug Administration's Center for Veterinary Medicine (CVM) on three beef implant products. Synovex Choice[®] is the foundation of new re-implant labels that are now available to feedlot operations, which also include Synovex Plus® and Synovex® One Feedlot.

"This approval provides beef producers with enhanced flexibility to more broadly use these technol-

Feedlot, 60 to 120 days later

Effective immediately, existing packages of Synovex Choice, Synovex Plus and Synovex One Feedlot can be used in reimplanting programs at feedlots. Animal health product suppliers and cattle producers will begin seeing updated labels with the approved reimplantation language by the end of 2022.

"The Synovex brand has contributed more than 66 years of growth productivity and innovation to the U.S. beef cattle industry," said Paul Parker, senior marketing manager, Zoetis. "We recognized the need and committed our resources to seek approval for these reimplant labels. These new label indications provide cattle feeders with proven options to help optimize performance in a profitable and sustainable manner."

For more information on how the expanded labels will fit your operation, please visit with your Zoetis sales representative. You also can visit www.Synovex.com to learn more.

Refer to individual labels for complete directions for use, precautions, and warnings. Re-implant only if and as directed in

up

Gorillas are always up for photo-ops.

They put their hands on the glass, look you in the eye, and ask, "What's

Okay, they don't really talk but you can tell what they're thinking. Things like, "They just don't pay me enough to put up with all these people."

My daughter, Noel, and I took the Littles to the Sedgwick County Zoo a couple of Saturdays ago. It was rainy, not a soaking rain, but enough to occasionally put up the umbrella and it kept the temperatures down most of the day. It was perfect. We spent four hours or more strolling from penguins to elephants to prairie dogs (the fattest prairie dogs I've ever seen! Their country cousins would be sending them to Weight Watchers!).

We also had the opportunity to get up close and personal with stingrays and baby sharks. The stingrays were like gray butterflies caught in the water, flitting here and there. My four-year-old grandson was brave and fed one a piece of shrimp (provided by staff) but the nearly six-year-old granddaughter thought it was gross.

Noel scours the internet and is always finding deals. The best one so far is the Sunflower Summer App that offers free admission to so many at-

Grass & Grain, August 9, 2022 tractions around the state. The program ends August 14, just as school is starting, but hopefully will be offered again next year. It made it possible for the kids to have experiences, at the Cosmosphere, for example, they might not have had otherwise.

We had lunch at the Zoo. It was by far the best lunch EVER at a zoo or just about any other attractions. Street tacos and quesadillas. The kids ate every bite. It was reasonably priced - a great value.

If you check out my Facebook page, my per-

Page 15 sonal page, you'll find the sweetest photo of the grandkids meeting the penguins. I sometimes wonder if the animals ever think, "It's really nice of them to bring such a variety of people for us to look at."

on tick causing concern in the cattle industry NCBA to host webinar

NCBA, in conjunction with USDA, is hosting a twoday webinar to discuss the Asian longhorned tick and its possible impact on the U.S. cattle industry. The free event will be held August 23-24 from 11:00 a.m. to 2:45 p.m. each day.

The webinar will provide cattle producers, state animal health officials, veterinarians and other key stakeholders with current information from industry experts about how to identify and manage the tick. Veterinarians from currently affected states and USDA officials will discuss disease implications, as well as possible

treatment options and prevention of ticks.

The Asian longhorned tick is an invasive pest first found in the U.S. in 2017. Since then, it has spread to 17 states ranging from the South to the East Coast. It has not yet been reported in Kansas, but has been found in Missouri. The tick is extremely mobile and very aggressive, causing stress and severe blood loss in cattle. It also carries diseases such as bovine theileriosis, which causes anemia, failure to grow, persistent infection, reproductive problems and, in some cases, death. There currently is no approved treatment for the disease

"This tick species is of great concern, but producers can protect their herd through frequent inspection and by reporting sightings to their veterinarian or local animal health official," said NCBA chief veterinarian Kathy Simmons. "The first step is knowing what to look for and I encourage producers to participate in this important webinar to receive the most current information."

Angus genetic experts present research to world stage in the Netherlands

importance of The Angus Genetics Inc. (AGI®) stretches far beyond running blood samples for Angus breeders. AGI strives to continuously research and develop worldwide, industry-leading technology in efforts to increase the efficiency and profitability of the Angus breed.

Association staff took their research beyond borders at the World Congress on Genetics Applied to Livestock Production (WCGALP) in Rotterdam, the Netherlands, July 3-8. Three American Angus Association staff members, five current or former interns and several external collaborators represented AGI at WC-GALP, one of the largest global livestock genetics events

"Angus had a strong presence at this year's WCGALP," said Kelli Retallick-Riley, AGI president. "It's crucial that we continue to be involved in these global conversations to keep Angus at the forefront of the industry."

Genomic Selection

Retallick-Riley discussed the evolution of genomic selection (GS). With GS rapidly evolving, providing accurate tools has become increasingly important. From multistep approaches to single-step genomic testing methods, the improvement of this selection criteria and its predictability has proven to be an invaluable tool tinued education about the value of GS along with making it accessible. cost effective and useful to make management decisions will continue to increase awareness and uptake of GS in the future, she noted.

Single-Step Genomic Evaluation

After introducing single-step genetic evaluations in 2017, the Angus breed has widely used this genomic selection method and has reached one million genotyped animals in its database. With such rapid adoption, questions arose about updating the original set of core animals to accurately represent the current whole genotyped popula-

National

Live Event:

Wednesday, August 17. 2022 • 10:30 AM MT

Elks Lodge 1319

28157 South US Highway 287, Lamar, Colorado

ONLINE SIMULCAST BIDDING:

Starts Monday, August 8, 2022, at 8:00 AM MT.

Bidding closes Wednesday, August 17, 2022, at end of live event.

tion, plus what benefits and potential downsides may result by making such a change on a national scale. Andre Garcia, AGI geneticist, presented research which concluded changes in the set of core animals only marginally affected animal ranking.

Pulmonary Arterial Pressure

AGI geneticist Duc Lu spoke about Angus advancements in pulmonary hypertension. Measured by mean pulmonary arterial pressure (PAP), pulmonary hypertension is defined as high blood pressure in the lungs and the right side of the heart, often associated at elevations 5.000 feet or more above sea level. Through

extensive research, the Association and AGI officially released an EPD for PAP to help Angus breeders make better selection decisions. With the rapid advancement of DNA, AGI has explored approaches to improve the accuracy and breeding value of PAP prediction. The research found that haplotype, HapA, has potential to help increase the accuracy of the PAP EPD for Angus breeders at high elevations to use as a valuable selection tool.

Additionally, the current and former interns and external collaborators presented research conducted alongside the Association

"The research conducted by the Association and AGI impacts the breed internationally," Retallick-Riley said. "We continue these research efforts to better serve our membership and the global Angus population."

For more information about AGI and the genetic tools it offers, visit www. angus.org/agi.

Elmer's Repair CENTRALIA, KS 785-857-3248 www.elmersrepair.com tral Kansas Warm Season Forage Field Day, scheduled for Aug. 18, said the event will showcase work being done in central Kansas to improve forages for cattle producers in the state.

Cade Rensink, the director of the Central Kansas Extension District, staff in his office Conservation District have established an onfarm demonstration of annual forages available in that part of the state.

The goal of the program, he said, is "to increase awareness about agronomics and the systems-use of warm and cool season forage crops."

by the Kansas Department of Agriculture's Division of Conservation. Rensink said other key cooperators include Saline County rancher Mike Henry, Star Seed, and Phillips Seed Farms. The August 18 field

day begins at 8 a.m. and is free to the public. The event will be held at 3421

Salina. Reservations are not required to attend. The field day agenda

includes:

• Tours of plots consisting of hybrid pearl millet, teff, crabgrass and photoperiod sensitive BMR sorghum-sudangrass.

• A discussion on identifying, concerns sericea lespedeza.

• Presentations by Henry as well as representatives of Star Seed and the Central Kansas Extension District.

For questions or more information, call the Central Kansas Extension District office at 785-309-5850.

PUBLIC NOTICE:

During a visit to the Harvesters Community Food Bank in Lawrence, U.S. Department of Agriculture under secretary for marketing and regulatory programs Jenny Lester Moffitt announced USDA's Agricultural Marketing Service (AMS) has signed a cooperative agreement with Kansas under the Local Food Purchase Assistance Cooperative Agreement Program (LFPA). Through LFPA, Kansas Department of Agriculture seeks to purchase and distribute locally grown, produced, and processed food from underserved producers. Under Secretary Moffitt was joined by Kansas gov-

ernor Laura Kelly, Kansas secretary of agriculture Mike Beam and Harvesters Community Food Bank president and CEO Steven Davis

"USDA is excited to partner with Kansas to promote economic opportunities for farmers and producers and to increase access to locally sourced, fresh, healthy, and nutritious food in underserved communities," said Moffitt. "The Local Food Purchase Cooperative Agreement Program will improve food and agricultural supply-chain resiliency and increase local food consumption around the country.

The Kansas Department of Agriculture (KDA) will purchase and distribute \$2.5 million worth of Kansas grown and processed foods to food insecure Kansans in underserved rural and urban communities across the state impacted by increasing inflation and limited access to fresh fruits and vegetables. KDA will partner with agriculture stakeholder groups to identify local, regional, and underserved farmers and ranchers and establish a tiered purchasing standard that gives preference to underserved farmers to expand their businesses.

"With this grant, we will be able to implement an exciting new program that will expand market opportunities for underserved local food growers and producers while also providing local food to underserved communities and families across Kansas," said Beam. "This partnership with local producers and with the state's food bank distribution network will benefit Kansans throughout the food supply chain."

The LFPA program is authorized by the American Rescue Plan to main-

tain and improve food and agricultural supply chain resiliency. Through this program, USDA will award up to \$400 million through non-competitive cooperative agreements with state and tribal governments to support local, regional, and underserved producers through the purchase of food produced within the state or within 400 miles of delivery destination.

More information about the program is available on AMS's Local Food Purchase Assistance Cooperative Agreement Program webpage

Reduce fertilizer cost with soil profile testing

By James Coover, Wildcat Extension District crop production agent

If there is one silver lining to a year of drought and failed corn, it's that there will be more nitrogen left in the soil for the wheat. How much nitrogen can really only be determined with a soil profile test. This deeper soil test will also determine the amounts of chloride and sulfur in the profile as well. A profile test can directly save on nitrogen applications and determine if extra sulfur or chloride is needed. This year nitrogen is very costly per unit, and droughtstruck corn could have left more nitrogen in the soil; it has never made more sense to profile test before wheat.

How to Profile Test

A profile test is taken slightly differently from a normal soil test for pH, phosphorus, and potassium. A profile test should be taken with an 18 to 24inch soil core, rather than a six-inch core. If there isn't 24 inches of soil to take, then however deep the probe can go. However, it is still important to take at least ten cores per soil sample. It is also important to have around the same depth for each core. While it takes longer to take a deeper soil sample, profile samples can represent a larger area. One per 40 to 80 acres is fine. Profile samples are really to get a general idea of what the soil still has left in it. While the number of cores

and depth are still important for profile samples, the results and recommendations they give do not need to be as exacting as surface samples. This is because mobile nutrients and immobile nutrients vary within the soil.

Mobile versus Immobile

Nitrogen, chloride, and sulfur are very different from the commonly tested phosphorus, potassium, and zinc. It is more than just the mobile nutrients, being anions, that move easily through the soil while the cationic immobile nutrients don't. They actually exist differently in the soil. When we test for immobile nutrients we are only getting an 'index' of total nutrients, merely a fraction of the total pool that we expect the plants can adsorb. When we test for mobile nutrients, we are getting the full amount, except for that contained in organic matter (which is also important to test for application recommendations). Nitrogen, chloride, and sulfur all have gaseous forms as well and can

application. I have seen plenty of six-inch surface samples tested for nitrates and sulfur because it was added to a surface sample. However, after an entire season of mobile nutrients moving down with the few drops of rain we have gotten, moving up during periods of evaporation, and being pulled into plant roots, it is impossible to tell where they are at this point. They could be concentrated in the top six inches... but probably not. The only thing for it is to test the entire profile and get the total amount. As mentioned before, mobile nutrients are determined in a total concentration, not an indexed plant-available approximation.

Profile Test Saves Costs

K-State nitrogen recommendations without a profile N test will assume a flat residual N amount of 30 lbs. per acre. This can easily be an underestimate during drought years like this one. 40 bu. corn yield will remove only 30 lbs. N per acre and seven tons silage will remove about 55 lbs. N. If 120 lbs. N was applied and 40 more from O.M. breakdown, even with denitrification, runoff, and other losses of 35 percent, that leaves 70 lbs. N left after 40-bu corn and 50 lbs. N after seven-ton silage. If a profile test finds 50 lbs. N per acre instead of the assumed 30 lbs. N, and with the current price of 75 cents per unit of N, then that is \$15 per acre. For a 60-acre sample, that's \$900 saved for a \$12 profile test. Past research has shown that residual N left in the profile after a drought year in corn can be up to 100 lbs. N per acre. However, before drastically cutting pre-plant fertilizer before the wheat, proof is needed of how much N is still there. The logic is simple. Poor yield due to drought leaves more nutrients in the soil and fertilizer is expensive, therefore, profile samples and surface samples are needed to find what nutrients are left. For more information about soil sampling or crops, please contact James Coover, Crop Production Agent, jcoover@ ksu.edu or (620) 724-8233.

GRASSLAND AUCTION 308.72 Acres MARION COUNTY GRASSLAND FRIDAY, SEPTEMBER 16, 2022 - 10:00 AM Sale held at the Marion County Lake Hall, 1 Office Drive, MARION, KANSAS 66861 egal Description: The west one-half of Section 36, Township 19 South, Range 5 East (W/2 36-19-5) Marion County, KS.

Land Location: From Jct. Hwy 56 /77 2 miles East of Marion (Roundabout), go 7 miles East on Hwy 150, OR from Jct. Hwy 50/150 South of Elmdale, KS. 9 miles west on Hwy 150.

Land Description: A quality native grass pasture located on the Marion County/Chase County line. Hwy 150 runs along the North boundary and a good county gravel road is along the west giving good access to this pasture in any conditions. The pasture is open and clean with no brush and trees with the exception of a few stray mature trees. The terrain is gentle rolling and can be driven with low profile car. Fences are primarily 5 and 6 wire with a small stretch of 4 wire. The entire east line has near new 6 wire fence with pipe bracing. There are 2 ponds for watering livestock in addition to a well with solar pump and stock tanks that is located in the west central area with easy access from the road.

Possession: Following the 2022 grazing season & upon full settlement AUCTIONEER'S NOTE: This is an exceptional pasture in the western Flint Hills having easy and good access. The land lays so well you can drive your car to check on livestock. The native and mixed grasses show care in stocking rates. A good wate well with solar pump gives you options for various seasonal uses. This is a nice size pasture to add to and expand any oper-

ation!! See you at the auction!! TERMS: \$50,000.00 earnest money day of sale payable to Security First Title Company. The balance will be due in full at closing which shall be on or before October 17, 2022. Title insurance and closing fees will be divided equally between buyer and seller. 2021 taxes were \$938.72. 2022 taxes will be paid by seller. All financing arrangements and /or inspections must be made prior to the auction. The property is being sold in an "AS-IS" condition and is not subject to financing o appraisal. All information is gathered from Marion County sources and is deemed reliable but not guaranteed. Six Isn't Good Enough

In truth, profile testing for the mobile nutrients is rare and I have seen very few come into the Extension offices over the years; largely, I assume, because profile soil tests are a 'snapshot' of what is in the soil at the time of the test. Therefore, the results can only be used one time and for one fertilizer

The Kansas Department of Agriculture has published a Kansas Agribusiness Commodity Flow Study, which analyses the movement of crops, livestock, and other agricultural products within and from the state of Kansas. The study was the result of a need identified through KDA's Ag Growth Strategy project which indicated that multiple sectors across Kansas agriculture would benefit from a thorough understanding of commodity flow both intra and interstate.

The report identifies key value-added processing, market, and demand points while assessing the role and utilization of infrastructure essential to commodity movement. Results from the report include information about net outflows of feed ingredients, the role played by road and rail infrastruc-

Care II

Page 20 Grass & Grain, August 9, 2022 Drought requires feed efficiency in cattle

Low supplies of hay make feeding cattle a challenge. Elizabeth Picking, a University of Missouri Extension livestock specialist in southwestern Missouri, sees the effects of severe drought in her area – dwindling hay supplies, poor-quality hay, high prices and ponds going dry.

Under these conditions, cattle producers need to be more efficient with feed, Picking says. This involves testing forages and calculating the cost of energy and protein to get the best value and results.

Most county Extension centers have hay sampling probes that producers can borrow for taking hay samples to test quality or nitrate content. Some offices have moisture and temperature probes for avoiding fires caused by hay that is too wet. Send samples to a laboratory certified by the National Hay Testing Association.

Consider weaning older calves when short on feed, supplementing feed during critical periods and culling nonproducers, Picking says.

Reviewing forage quality and dry matter intake during growth and reproductive stage helps producers **Certified Angus Beef and D** determine needs. Also, an understanding of protein and energy for spring and fall calving helps.

Cows need energy-producing supplement when hay supplies are low. Picking suggests a review of crude protein and total digestible nutrient percentages.

Producers can stretch hay supplies by substituting one pound of grain to replace two to three pounds of hay, she says. Cattle need at least 0.5% of their body weight in dry matter of forage per day. Cattle will initially appear gaunt and hungry but will adapt within two to three weeks.

One alternative is tubs of supplemental protein and minerals. They vary widely in price, contents and daily consumption. These come in a cooked and block forms. The moisture-dense blocks are usually cheaper than cooked tubs, but they may be more expensive per unit of nutrient. Blocks are easier to handle than cooked tubs, weighing 30-35 pounds rather than 100-500 pounds. They are best suited to small herds, Picking says. Use salt to limit feed intake. Cattle can eat about 0.1 pound of salt per 100 pounds of body weight per day. Mix with commodity feed to limit intake if using a free choice feeder. Cattle can overeat, so take care to limit supplies. Salt increases water needs, and this can be a problem when ponds run dry.

Another option is adding liquid feed on low-quality hay. This improves palatability, reduces dustiness and gives cows extra protein and energy. Limit urea to no more than half of the daily protein source.

Stockpiled fescue can be fed when endophyte levels are lower in January and February. Graze stockpiled Bermuda grass early in winter, Picking says.

The MU Extension publication "Drought-Related Issues in Forage, Silage and Baleage" is available online at extension.missouri.edu/agw1017.

More information on forages is available from the Alliance for Grassland Renewal at www.grasslandrenewal.org. The alliance includes partners from university, government, industry and nonprofit groups.

Certified Angus Beef and Ducks Unlimited partner to preserve working grasslands

By Abbie Lankitis and Kylee Kohls

Grass and water.

These are the essential elements in beef production — the same resources vital to healthy waterfowl populations. Productive agriculture and conservation go hand in hand.

That's why Certified Angus Beef announced a collaboration with Ducks Unlimited at the 2021 Angus Convention in Fort Worth, Texas. Together, the two organizations assembled half-a-million dollars to launch the Working Grasslands Conservation Initiative, helping unlock an additional \$2.5 million in grants to fund the initiatives' work over the next three years.

Supporting economic and environmental stewardship, this project allows cattlemen to lean on the technical expertise of Ducks Unlimited personnel through voluntary, cost-sharing programs focused on preserving and restoring grasslands important to cattle ranching, duck populations and our climate in the Northern Great Plains.

"Together, we can deploy more voluntary, incentive-based programs that work for the Angus rancher while advancing carbon sequestration, clean water and biodiversity," says Bruce Cobb, executive vice president of production for Certified Angus Beef.

The three-year initiative includes financial and technical assistance to interested landowners, notes Billy Gascoigne, director of agriculture and strategic partnerships for Ducks Unlimited.

"This collaborative work rallies around ranch-

erers facing growing challenges while being the stewards of our remaining grasslands and wetlands in some of our most priority landscapes," he says. "We see ranchers trying to keep improving how they produce cattle while remaining economically viable. We want to make sure they have the resources us needed and help elevate the critical role of live-

stock in preserving this critical habitat." "Certified Angus Beef is committed to demonstrating the benefits of beef production beyond a great steak," Cobb says. "Healthy ecosystems come along as a byproduct of raising the best tasting

beef." Third-generation ranchers from the James River Valley in Glenfield, North Dakota, agree. Brothers Justin and Nathan Spickler made good use of Ducks Unlimited

cost-share programs, each run their own Angus seedstock herds and grow forage crops.

"We live in the area where the tall- and shortgrass prairies meet," Justin says. "It's great grass and very productive, with a wide species variety so we can raise heavy calves without supplemental feed."

That makes Spickler pastures a perfect symbiotic habitat for waterfowl and Angus cattle.

Waterfowl nest upland and need grass to procreate, sometimes miles from the nearest water.

Justin linked with Ducks Unlimited in 2017 and Nathan in 2019 on similar projects. They costshared fencing and built water tanks supplied by solar energy, as well as grazing cover crops.

"By starting in our rye, we hit native grass about a month later than normal," Nathan says. "It allowed us to rest our grasses way more than what we could otherwise in the drought."

Justin appreciates the common ground: "Improvement of range land helps us both," he says. "This is a good relationship — helping people raise Angus beef. It's a win for both."

Often called the most endangered ecosystem in North America, the tallgrass prairie offers valuable, resilient carbon storage. One of the best ways to maintain these vital grasslands are through livestock integration on family farms and ranches.

"These lands are more sustainable now and in the future when they are being stewarded by ranchers grazing livestock," Gascoigne says. "Our conservation staff live in these same communities and are vested in developing programs that meet local needs. We sit down at the kitchen tables with farm families and identify solutions through fencing, water development, cover-crop seeding, soil health evaluations, and rotational grazing to make better grass and wetland conditions."

The Prairie Pothole Region (PPR), which extends far into Canada, stretches in the U.S. from northwest Montana to central Iowa and hosts more than 4 million ducks in its grass biomes.

Historically, half to as much as 80% of North American waterfowl utilize the PPR to nest and rear their young. This same region has been important to ruminant animals for centuries – first bison, now cattle.

"We know these grasslands evolved with grazing animals—an important factor in rangeland and soil health," Gascoigne adds. "Working in this landscape for 85 years, we recognize that proactive work with private owners — farmers and ranchers lets us achieve a lot more win-wins at a scale important to the sustainability of waterfowl and cattle production."

Cattlemen often surround themselves with advisors and expertise outside their primary focus, Cobb says. It creates a team.

"If you have a cattle operation, you have vets, nutritionists, risk managers, bankers and tax accountants," he notes. "Why not have somebody to help you understand the health of your land?"

The people at Ducks Unlimited understand conservation biology. rangeland health and agronomy. Gascoigne adds, "We know less about how to drive value back to these ranchers so they can be economically sustainable for generations to come. The experience of Certified Angus Beef in this realm is what's so powerful about this work: to have diversity within the sustainability views of economics — environmental, social and cultural."

Both organizations understand maintaining grasslands requires sustained ranching. The Working Grasslands Conservation Initiative is a unique partnership for a unique time, meeting the call of consumers while supporting family ranchers.

2022 GEARY COUNTY FAIR LIVESTOCK GRAND AND **RESERVE CHAMPIONS**

Addy Snider earned Grand Champion Bucket Calf in Reserve Champion Bucket Calf in the 7-9 year-old the 7-9 year-old division.

Tyler Proietti was awarded the Reserve Champion Bucket Calf in the 10-12 year-old division.

Cody Brown won Grand Champion Market Beef with his 1300-pound Gelbvieh. Judge for the show was Jacob Schmeidler.

Natalie Hall took home the Grand Champion Dairy Goat award with her Senior Nubian Doe.

division was earned by Nolan Langvardt.

Kaycee Brown took home Grand Champion Breeding Beef with her Gelbvieh/Balancer Junior Yearling

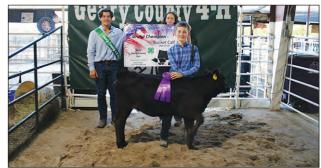

This 1298-pound Hereford owned by Kaycee Brown was selected as Reserve Champion Market Beef.

The Reserve Champion Dairy Goat was awarded to Sammie Hall with her Senior Nubian Doe.

The Grand Champion Bucket Calf in the 10-12 yearold division was awarded to Jacob Roeser at the Geary County Free Fair.

The Reserve Champion Breeding Beef was a Gelbvieh/Balancer Aged Cow shown by Cody Brown. Brown was also selected as Reserve Champion Beef Showman.

Tava Gustafson was awarded Grand Champion Beef Showmanship honors.

The Grand Champion Horse was an aged gelding shown by Grant Slough. Slough also earned Grand Champion for Horse Showmanship.

The Reserve Champion horse was an aged mare shown by Tava Gustafson. Judge for the show was Beth Hecht

Kaycee Brown took home Grand Champion Breeding Goat. Brown also earned the Reserve Champion Goat Showman award.

Nora Kvacik was Reserve named Champion.

In the Horse Show- Kaycee Brown's 94-pound manship division, entry was chosen as the Grand Champion Meat Goat. Judge for the show was Tatum Brunkow.

Page 23 Cut cattle feed costs; don't cut corners ment and improves drying the grazing in underuti- the value returned."

Maximize efficiency and minimize waste to help cut feed costs without impacting production.

Whether you're in an area suffering from drought or not, cattle feed cost is the single largest expense in the cow-calf sector, and prices are still on the rise. Although the future looks strong, with a recent CattleFax report predicting the gap between calf prices and cash cow costs to narrow in 2022, the current situation has producers asking, "Where can I cut?"

"Decisions made today can affect calf weaning weights this year, how quick a cow will rebreed and calve next year, and even the weight of her next year's calf," reminds N.T. Cosby, Ph.D., senior consulting nutritionist with Purina Animal Nutrition. "Producers looking for cost savings should choose strategies to save money now, without losing advantage in strong markets later.'

"Utilizing tactics to cut waste and inefficiencies when feeding cattle can have an impact on an operation's bottom line," says Cosby, "The goal is to cut costs without sacrificing performance."

Explore management strategies to help reduce cattle feed costs:

1. Maximize stored cattle feed

When cattle feed is not stored properly, it loses volume and nutritional value. Avoid shrink loss and packing issues by harvesting haylage and silage at the right moisture level. Ensure proper fermentation by storing in an anaerobic environment and utilizing inoculants.

Inside storage for hay is ideal, but when not feasible, store on a surface that allows for drainage, such as gravel, tires or railroad ties, to keep the underside of bales dry. Proper spacing between bales allows air movewhen the weather does impact bales.

Be aware of storing timelines when feeding wet byproducts. Distillers' grains and gluten must be fed within four days in summer and within a week in winter.

2. Take advantage of grazing opportunities

In areas with available pastures, a strategic grazing program can help increase your operation's carrying capacity, extend grazing days and reduce dependence on harvested and stored feed.

Design a cattle grazing program to make the most of your available forages:

Grazing programs can include strategic fencing, water placement, herding, pasture rotation and rest. forage species variation and more.

Consider strip grazing crop aftermath, like corn stalks.

Encourage cat-

lized pasture by limiting them to certain pasture sections and slowly adding and removing sections over time.

Supplements such as blocks, protein tubs or liquid supplements can promote cattle grazing in underutilized pasture or range areas, potentially increasing grazing days.

3. Monitor mineral intake

"A well-balanced mineral supplement is the cornerstone of a nutrition program that can impact reproduction, health, longevity, soundness and efficient energy utilization," Cosby emphasized.

The biggest factor affecting mineral cost is consistent intake.

"If a mineral isn't being consumed, the rancher has paid for something that is giving no return.' says Cosby. "If the mineral is over-consumed, the cost per day may exceed

rect access to the pond.

Monitor mineral intake and adjust the number of mineral feeders and the location of feeding stations to achieve your goal consumption rate.

4. Avoid hay waste

According to the University of Nebraska, feeding hay to cattle with 24hour free-choice access can result in 25-45% hav waste due to sorting, trampling on and soiling the hay. Feeding hay in smaller amounts and in well-drained areas can reduce waste. Also, research the most efficient hay rings or utilize "hay traps" that reduce access time. Operations in drier climates or range settings may consider unrolling hay or processed forages.

"The cow-calf business is more of a marathon than a sprint," shares Cosby. "Cutting extra input costs from waste and inefficiency can allow you to make your feed dollars work harder now and

keep your operation on track for long-term goals."

Visit purinamills.com or contact your local Purina® dealer for tips on cutting feed costs without cutting performance.

Purina Animal Nutrition LLC (www.purinamills.com) is a national organization serving producers, animal owners and their families through more than 4,700 local cooperatives, independent dealers and other large retailers throughout the United States. Driven to unlock the greatest potential in every animal, the company is an industry-leading innovator offering a valued portfolio of complete feeds, supplements, premixes, ingredients and specialty technologies for the livestock and lifestyle animal markets. Purina Animal Nutrition LLC is headquartered in Arden Hills, Minn. and a wholly owned subsidiary of Land O'Lakes, Inc.

pond stress in anaging drought

drought Continued combined with high temperatures can have devastating effects on fish ponds.

During a drought, pond waters can drop to dangerous levels, increasing aquatic plant growth, decreasing water quality and stressing fish, making them more vulnerable to disease and death, says Bob Pierce, University of Missouri Extension fisheries and wildlife state specialist.

The MU Extension publication "Managing Missouri Fish Ponds During an Extended Drought," developed by Pierce and retired Lincoln University aquaculture specialist Charles Hicks, is available for free download at extension.missouri.edu/g9401.

Ponds in very small watersheds or on marginal soils typically are the first to have problems as water levels decrease through seepage, evaporation and lack of runoff. Pierce says. Among the problems that can occur:

• Fish may become

stressed as they are confined to smaller volumes of water.

 Waste metabolites such as ammonia, carbon dioxide and nitrates are concentrated, which can further stress and even kill fish.

· Less dissolved oxygen is available for the fish as they and other aquatic organisms are crowded into smaller volumes of water.

• Unwanted aquatic vegetation and algae begin to grow as nutrient levels in the pond become more concentrated.

Pond water level

Drought conditions will create shallow areas that expose plants to more sunlight and encourage rapid growth. Aquatic plants can be reduced or controlled through practices such as using recommended aquatic herbicides and stocking grass carp. Texas A&M University's Aqua-Plant website at aquaplant.tamu.edu has excellent aquatic plant identification and control recommendations, Pierce says.

oxygen Drought increases the

danger of oxygen depletion in ponds. Warm water holds less dissolved oxygen than cooler water. Algae and aquatic plants become more abundant in warm water and in ponds with lower water levels. While plants produce oxygen in daylight, they consume oxygen at night and during extended cloudy periods. Also, intense sunlight can cause algal blooms to die off, which further depletes oxygen. More abundant vegetation can also cause wide swings in pH levels.

Supplemental aeration in ponds can protect fish during a drought, Pierce says. The simplest solution is an electric aerator that provides about 3/4 horsepower of efficient aeration per acre of pond.

Reducing the chance of a fish kill during drought

Pond owners can take preventive actions to reduce the chance of fish kills in drought-affected ponds.

• Keep cows and other livestock from having di-

Wading livestock will muddy the water and further stress the fish. Manure in the pond will contribute to oxygen depletion. • Do not apply aquatic herbicides to the pond

during a drought. High temperatures and reduced water volume will heighten the risk of oxygen depletion as a result of increasing plant decay.

• Take measures to thin the existing fish population, such as fishing the pond more.

Observe your pond and quickly react to changes

If possible, observe your pond daily during a drought. Timely action may save your fish or reduce treatment costs. Plan for how you will take corrective action when a problem is identified.

Contact the Missouri Department of Conservation or your local MU Extension center for additional recommendations on controlling nuisance aquatic plants, managing pond water quality and preventing a fish kill during a drought.

NCBA announces 2023 farm bill priorities

At their recent Summer Business Meeting in Reno, NCBA announced its priorities for the 2023 Farm Bill based on producer input gathered during the meeting.

Our annual meetings are the cornerstone of NC BA's grassroots policy process," said NCBA president Don Schiefelbein, a Minnesota cattleman. "Individual producers set the course for NCBA's advocacy work in Washington, D.C., and we have heard from many producers who value the animal health, voluntary conservation and disaster recovery programs in the last Farm Bill and look forward to improving those programs in the next Farm Bill

NCBA farm bill priorities include:

Protecting animal health through programs that guard against the spread of foreign animal diseases such as the National Animal Vaccine and Veterinary Countermeasures Bank, which currently houses the Foot-and-Mouth Disease vaccine. NCBA previously advocated for this vaccine bank in the last Farm Bill and producers recognize the danger that a foreign animal disease poses to the industry and the protection this bank provides.

Strengthening risk management programs that provide producers with added protection against weather events and price decline.

Promoting voluntary conservation programs that provide support for producers to implement conservation practices free from government mandates.

Supporting disaster recovery programs that help producers return to normal operations following adverse weather, attacks by predators, or extreme conditions like drought and wildfire.

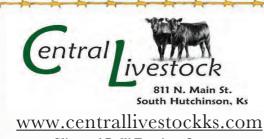

Additionally, cattle producers amended and renewed existing policy on the books on issues including cattle health, federal lands, environmental policy, trade, markets, taxes, transportation, food safety, and more. If you have any questions about the meeting or NCBA policy priorities, contact Ben Weinheimer at ben@tcfa.org or (806) 358-3681.

Page 24 Grass & Grain, August 9, 2022 Don't underestimate the value of early pregnancy detection

By Ross Mosteller. Meadowlark District Extension agent, livestock and natural resources

As I sat down to look at my annual "pull the bulls" date on the calendar, it got me thinking about a timely topic to write about. Every operation has a different timeline for breeding, calving, weaning, marketing... name the subject; but one thing that can be useful sooner rather than later is to know which animals are bred and when in the calving season they are expected to calve. Knowing this information early can help direct management decisions.

There are a number of reasons ranging from shortage of forage resources to marketing opportunities that proves the value in knowing when a cow is pregnant. That information can be used to identify early bred replacements or open females to remove from pasture, in order to extend the grazing season. Heifers confirmed pregnant to an AI sire likely can bring premiums. A group of yearling heifers pregnant with heifer calves would be expected to have less calving difficulty and may be worth more than those carrying males. Looking at the cull side, the cull cow market historically declines the deeper into fall aligning with the common weaning times of spring calving herds. The more cows being culled,

timely marketing. Whatever the reason, you have to check to know what the status of the females and can then make decisions with that information.

Rectal palpation is the most commonly available tool for pregnancy determination. Experienced technicians can be comfortable with distinguishing 35- to 40-day pregnancies. In the hands of a trained person, a fairly high degree of accuracy in stage of pregnancy can be determined up until 100-120 days of gestation, before the uterus descends over the pelvic rim. It is becoming more common place for bovine practitioners to offer ultrasound detection. Embrvos can be identified as early as 25 to 28 days of age, but 30 days makes a more practical lower age limit. Fetal sexing requires additional experience with ultrasound to gain higher accuracy, but is a benefit to this meth-The earliest time od. to fetal sex is around 55 days but due to variation in development, a time period of 60 to 100 days is generally targeted.

Commercial blood tests are also available to determine pregnancy status. The tests detect one of a number of pregnancy specific proteins produced by the placenta. Depending on which protein and test provider. earliest detection date varies from 28 to 30 days of gestation and proteins remain in the system up to 75 to 90 days after

calving. A disadvantage of the blood test is that since the proteins remain in the animal's body after any fetal loss occurs, a positive test indicates both if the female is OR was pregnant and could now be open.

Some embryonic and fetal loss is normally occurring, from 1 to 2% by the second trimester to term is considered normal. Mostly this loss is seen before day 30, but some cows pregnant at 30 days will not be pregnant at day 60. Although early pregnancy loss is not uncommon, and is generally not caused by the process of pregnancy checking, it does mean if performed relatively early it may need to be repeated.

ian can discuss timing and options that best fit your production situation and goals. Stage of pregnancy can be very valuable information when making decisions related to pasture management, adjusting winter feeding plans and trying to take advantage of market opportunities. Processing cattle through a working facility in the heat of summer, may not be high on your wish list of things to do, but giving pregnancy detection, especially early detection, might be worth considering. Your business will be in a better position to adapt to variation in weather and markets with detailed information on pregnancy status and stage of fetal development.
