Abandoned fields and low yields underscore Wheat Tour 2023 The 2023 Wheat Quality Council's Hard Winter Wheat

Tour across Kansas wrapped up on May 18. During the three days of wheat scouting, tour participants traveled six routes from Manhattan to Colby to Wichita and back to Manhattan. This year's tour hosted 106 people from 22 U.S. states plus Mexico, Canada and Colombia, in 27 vehicles while traveling across the state.

The three-day average calculated yield for the fields that will be harvested was 30 bushels per acre.

While an estimated 8.1 million acres of wheat were planted in the fall, the Kansas wheat crop has suffered from a multi-year drought, which has robbed the state's yield potential and resulted in many abandoned fields.

The official tour projection for total production of wheat to be harvested in Kansas is 178 million bushels, indicating that tour participants thought abandonment might be quite a bit higher than normal at 26.75%. The

production number is the average of estimated predictions from tour participants who gathered information from 652 fields across the state. Based on May 1 conditions, NASS predicted the crop to be higher at 191 million bushels, with a yield of 29 bushels per acre and abandonment at 18.5%.

On Thursday, yields in areas between Wichita and Manhattan were better than what participants had seen earlier on the tour, improving as they moved north, averaging 44.1 bushels per acre.

For fields that have not yet headed out, scouts use an early season formula model to calculate the potential yield of the fields. The model uses an average head weight based on 2013-2022 Kansas wheat objective yield data. For the fields that had already headed, attendees were able to use a late-season formula to calculate vields, based on number of wheat heads, number of spikelets and kernels per spikelet. These formulas are provided by USDA's National Agricultural Statistics Service. The formulas do not take into consideration variables such as weed pressure, disease and pests. Tour scouts didn't see much disease pressure this year with the drought conditions.

The tour captures a moment in time for the yield potential for fields across the state. These fields are still three to six weeks from harvest. A lot can happen during that time to affect final yields and production.

The tour is sponsored by the Wheat Quality Council, which is a coordinated effort by breeders, producers and processors to improve wheat and flour quality. The primary goals of the tour are to make connections within the wheat industry, allow participants to meet wheat farmers and see the growing crop and to highlight the agriculture industry.

New research reveals how grazing management practices affect cattle weight gain by altering foraging behavior

Rotational or continuous grazing? Which system allows for more sustainable and profitable freerange livestock production?

Ranchers often rotate cattle seasonally among different pastures on their operations but may allow cattle to graze season-long in a single pasture. Implementing a more intensive rotational system within the growing season — dividing the pasture into smaller areas, or paddocks, and shifting a herd of animals throughout the season — has been suggested to offer a greater chance for more sustainable grazing management. However, there have been very few experimental studies testing these ideas in extensive grazing sys-

A team of researchers at the USDA's Agricultural Research Service is completing a ten-year study on how grazing practices used in these two systems affect cattle foraging behavior,

tems.

diet quality, and yearly weight gain in semi-arid, extensive rangelands.

The team started by exploring the efficiency of using cattle global positioning system (GPS) tracking collars, combined with activity sensors, to monitor the animals' grazing activities.

"The primary objective of the study was using the sensors to measure the steers' foraging behavior. and relate this to how they are gaining weight," said David Augustine, a research ecologist with the ARS Rangeland Resources and Systems Research in Colorado.

The collars collected precise data based on the animals' feeding habits per day, such as how much time was spent grazing every day, how many steps were taken (grazing speed), the shape of the foraging pathways, and how long each animal lowered their head as a sign of eating (representing the length of meals).

Even though the accuracy of the application is still being refined, results showed that the technology can inform livestock managers about animal distribution and foraging behaviors of free-ranging cattle in extensive rangelands. Being able to monitor foraging behavior continuously in turn allows managers to make more timely decisions on how, when, and where to move cattle within their operation, or to sell cattle at

The researchers then applied the same technology in a range-scale experiment where steers were either divided into smaller herds in the paddocks of a non-rotational (season-long) grazing system or managed as a single large herd in a multi-paddock rotational system (using a collaborative and adaptive rangeland management approach). The first five years of data showed that the rotationally managed cattle gained, on

optimal times.

average, 14 percent less weight than cattle in the season-long management system.

"Cattle did not have as much freedom to roam and be more selective on what to eat, so they ended up eating what was available in front of them, which was lower quality forages with less protein, and they gained less weight as a result. These behaviors were directly correlated to the average of 14 percent reduction in steer weight gain in the multi-paddock rotating system compared to the non-rotational continuous system," explained Augustine.

The study showed herds in the multi-paddock rotating system feeding in more linear pathways instead of moving around looking for greener grass and selecting bites of more digestible vegetation. They also fed slower, spent more time on the same patch of grass, and didn't turn their heads

around much while feeding, compared with steers in the continuous grazing system. These behaviors of less selective foraging resulted in a lower diet quality, which led to reduced weight gain during the growing season.

Results, published in Agriculture, Ecosystems, and Environment, show that large herds grazing in small, homogenous paddocks have little opportunity to move around in ways that let them feed on high quality diet.

The collaborative experiment was conducted at the Central Plains Experimental Range, an ARS Long-term agroecosystem research network site in Colorado.

Augustine and coauthors Sean P. Kearney. Edward J. Raynor, Lauren M. Porensky, and Justin D. Derner, hope this study can help better understand cattle foraging behavior and assist rangeland managers in selecting grazing practices between a traditional continuous system versus a collaborative multi-rotational system.

Kansas Hay Market Report

Compared to the last report demand remains good, prices remained mostly steady, trade activity remains slow. Many areas received rain last week! Producers report that the alfalfa is short but at least with the precipitation it is greening up and growing. New crop price remains elusive, but folks seem now to be mulling it over. According to the U.S. Drought Monitor for May 9th convective rainfall, typical for early May, occurred this past week across parts of Kansas and Nebraska. However, in areas that missed out on this rainfall, a one-category degradation was necessary for parts of southern Nebraska and central to eastern Kansas. According to the U.S. Department of Agriculture, 64 and 68 percent of the pastures and ranges for Kansas and Nebraska, respectively, are rated poor to very poor. The categorical percent area for abnormally dry conditions (D0) increased to 7.5%, moderate drought (D1) remained near 8%, severe drought (D2) remained near 12%, extreme drought (D3) decreased to 23%, and exceptional drought (D4) remained near 40%

Southwest Kansas

Dairy alfalfa, grinding alfalfa, ground and delivered steady, movement slow. Alfalfa: horse, supreme small squares 14.00-15.00/bale. Dairy,1.40-1.50/point RFV. Good, Stock or Dry Cow 300.00-315.00. Grinding alfalfa, large rounds, 295.00-300.00, large square 3x4's and 4x4's 305.00-315.00. Ground and delivered locally to feed lots and dairies 340.00-350.00. Alfalfa/grass hay mix ground and delivered 310.00-320.00; Grass Hay: Bluestem: 150.00-160.00. The week of 5/7-5/13, 6988.75T of grinding alfalfa and 550T of dairy alfalfa was reported bought or sold.

month, which includes mixed loads, usage was 647T/day, up 33% and total usage was 19,421.5T.

South Central Kansas

Dairy alfalfa, ground and delivered, and alfalfa pellets steady, grinding alfalfa steady to 5.00 lower, movement slow. Alfalfa: horse, small squares 325.00/ton. Dairy 1.40-1.50/point RFV. Good, Stock cow, 295.00-305.00. Fair/ good grinding alfalfa, large rounds 295.00-305.00 delivered, 3x4 and 4x4's *295.00-305.00 delivered. Alfalfa ground and delivered 320.00-330.00; Alfalfa/Soybean: ground and delivered 295.00-310.00. Alfalfa pellets: Sun cured 15 pct protein 325.00-335.00, 17 pct protein 345.00-350.00, Dehydrated 17 pct 395.00-400.00. Grass Hay: Bluestem, large rounds none reported. The week of 5/7-5/13, 6,939.5T of grinding alfalfa and 0T of dairy alfalfa was reported bought or sold. The average paid by feedlots on May 1 for alfalfa ground and delivered was \$261.72, down\$4.63from the previous month, which includes mixed loads, usage was 212T/day, down 20% and total usage was 6,360T.

Southeast Kansas

Dairy alfalfa, grinding alfalfa, grass hay steady, movement slow. Alfalfa: horse or goat, none reported. Dairy 1.40-1.50/point RFV. Good, stock cow 260.00-270.00. Fair/ good grinding alfalfa, large rounds none reported, large square 3x4 265.00-275.00; Grass hay: Bluestem, small squares 160.00-165.00, good 3x4 squares 160.00-170.00, large round 140.00-150.00. Brome, large square 180.00-200.00 delivered. Corn stalks: none reported. The week of 5/7-5/13, 1,026T of grass hay was reported bought or sold.

Northwest Kansas

Dairy alfalfa and grinding alfalfa steady, movement slow. Alfalfa: Horse or goat, small squares 300.00-320.00, 3x3squares 305.00-320.00 delivered. Dairy, Premium/Supreme 1.40-1.50/point RFV. Stock cow, fair/good 295.00-300.00. Fair/good grinding alfalfa, large square 3x4's 295.00-310.00.

Dairy alfalfa, ground/delivered and bluestem grass

hay steady, grinding alfalfa mixed, movement slow. Alfalfa: Dairy 1.40-1.50/point RFV; Horse hay, premium small squares, 12.50-13.50/bale, 3x4's 290.00-300.00; Stock Cow 3x4's 230.00-240.00. Fair/good, grinding alfalfa, large rounds 240.00-250.00,large square 3x4's 290.00-300.00 delivered; Alfalfa ground and delivered 275.00-300.00; Alfalfa/Prairie grass mix ground and delivered 270.00-275.00. Grass hay: Bluestem, small squares none reported, large 3x4 squares 150.00-160.00, good large rounds 155.00-165.00. Brome:large rounds, 150.00-160.00. Sudan: large round 130.00-150.00. Wheat straw: large squares 120.00-130.00. Corn stalks: large squares 135.00-145.00 delivered. The week of 5/7-5/13,768T of grinding alfalfa and 125T of dairy alfalfa was reported bought or sold.

** Prices above reflect the average price. There could be prices higher and lower than those published.

***Prices are dollars per ton and FOB unless otherwise noted. Dairy alfalfa prices are for mid and large squares unless otherwise noted. Horse hay is in small squares unless otherwise noted. Prices are from the most recent sales. *CWF Certified Weed Free

*RFV calculated using the Wis/Minn formula.

**TDN calculated using the Western formula. Quantitative factors are approximate, and many factors can affect feeding value. Values based on 100% dry matter (TDN showing both 100% & 90%). Guidelines are to be used with visual appearance and intent of sale (usage). Source: Kansas Department of Agriculture - Manhattan, Kansas Kim Nettleton 785-564-6709.

KLF awards 28 Merck **Animal Health scholarships**

The Kansas Livestock Foundation has awarded 28 scholarships totaling \$31,000 for the 2023-24 school year. Five students attending the Kansas State University College of Veterinary Medicine each have been awarded a \$1,500 scholarship through the Merck Animal Health Cartridges for Cash (CFC) program.

Receiving veterinary school scholarships are Mallory Beltz of Sterling, daughter of Daren and Shawna Beltz; Mackenzie Birney of Bucklin, daughter of Kevin and Bev Birney; Laura Carpenter of Wamego, daughter of Joe Carpenter and Barb Downey; Caleb Hildebrand of Stafford, son of Jason and Carrie Hildebrand; and Jerilyn Nelson of Soldier, daughter of Jerry and Jo Ann Nelson.

Two K-State students received \$1,000 CFC scholarships. Regan Ast of Ingalls will be a senior and is the daughter of Karla and Tom Ast. Rayleigh Wittman of Garnett will be a junior and is the daughter of Rod and Kim Wittman.

These scholarships are funded by Ralgro and Revalor cartridges being turned in to Merck representatives or taken to a KLA meeting or the KLA Convention. Each cartridge is worth 25¢. Since Finney County KLA members turned in the most cartridges in 2022, one student from that county was awarded a \$1,000 CFC scholarship. Adison George of Holcomb will be a sophomore at Garden City Community College and is the daughter of Darren and Jill George.

Monona, Iowa, has been selected as the 2023 Don and Jane Good Outstanding Senior.

While an undergraduate student in Animal Sciences and Industry (ASI) at Kansas State University. Weigand was a member of the 2022 National Champion Meat Animal Evaluation Team, 2022 Livestock Judging Team and the 2023 Champion KSU ASI Academic Quadrathlon Team. Weigand served as the assistant coach for the 2023 National Champion Meat Animal Evaluation Team.

Weigand served as K-State Block and Bridle president and is a member of K-State Collegiate Cattlemen. Additionally, Weigand was an ASI Mentor, meeting with prospective students and their families and assisted with departmental events.

In addition to being a member of competition teams and a leader within departmental organizations, Weigand was involved in a variety of research projects. She participated in an independent study with Ashlev Hartman, ASI doctorate

student, titled "Impact of Structural Traits on Semen Collection Training and Lesion Characteristics in Duroc Boars." Additionally, she did an independent study with Dr. Cassandra Olds, Department of Entomology, titled "KDR and Super KDR Gene in House Fly Pesticide Resistance." As part of the Undergraduate Research program, her project was at the Swine Research Unit and it compared five diets and was titled "Effects of Microencapsulated Zinc Oxide on Nursery Pig Perfor-

Weigand has traveled

internationally to the Agribition Livestock Exhibition and this spring will attend the Switzerland studying abroad trip with Dr. Scott Beyer.

"Macie took full advantage of opportunities available within the ASI Department," says Mike Day, KSU ASI department head. "Her participation in academic and competition teams, dedication to research, and efforts to understanding agriculture abroad are notable. It is truly evident that Macie has a passion for teaching others about the agriculture industry and how their food is produced. We are excited to see the research she continues to do within our department."

Weigand took advantage of experiences preparing her for a career within the industry. During the summer of 2022, she was a cattle field sales intern for Merck Animal Health. In this role she primarily focused on the sale of Safe-Guard Dewormers in the Midwest, met with current and potential vet clinic and producer customers.

and pulled complimentary fecal sample kits.

Kansas State Universi-

The webinars

May 24 - Using Basis and Margin Tools for Making Real World Ranch Management Decisions During Drought. Brett Crosby, Custom Ag Solu-tions, https://tinyurl.com/

May 31 – Use of K-State's

cision Aide in Assessing https://tinyurl.com/KSUB-

June 7 - Strategies for Feeding Cows with Limited Forages. Jason Warner, K-State Extension Cow-Calf Specialist. https://ti-nyurl.com/KSUBeefFeed-

June 14 - Feeding and Managing Early Weaned Calves. Justin Waggoner, K-State Beef Systems Specialist, https://tinyurl.com/

counties in Kansas are abnormally dry or classified in some degree of drought. Many counties have experienced persistent severe drought since late 2021. K-State officials note that not only have producers dealt with forage shortages, high forage and feed ingredient costs, and toxic forages, but water quality and availability is also an

More information is available from Warner at 785-532-1460 or jasonwarner@ksu.edu; or Sandy Johnson at 785-462-6281 or sandyj@ksu.edu.

In May 2022, Weigand spent two days in Schuyler, Nebraska, helping collect data for the National Beef Audit. Her role was helping record information from the kill floor like ear tag identification, breed type and sex to be utilized in the report for future improvements to the beef industry.

Weigand plans to pursue a master's degree at K-State with Dr. Dale Blasi in ruminant nutrition focusing on ways to improve animal health in receiving cattle. She is also going to work with Dr. KC Olson on some burn studies, as well as feeding garlic in

free range cattle mineral to help with pest management both internally and externally in cattle. She will also continue to serve as a graduate assistant coach for the meat animal evaluation team.

"I'm excited for my future academic path and the opportunity to influence the next group of students at K-State," Weigand savs. "My long-term goal is to find a career in Extension or academia that allows me to continue to do research and pass on my knowledge to the livestock industry in a way that continues to provide a safe, nutritious and environmentally conscious food supply."

The Don and Jane Good Outstanding Senior Award was developed in 2010 to recognize those that exceed expectations of involvement in the animal science department. These criteria were developed to match the legendary example set by Good: moral character, scholarly achievement, leadership skills, participation on judging teams, foreign and domestic travel, potential of contributing to humankind in the future and written and oral communication skills.

KBC, Pit Boss team up for Beef Month challenge

The Kansas Beef Council (KBC) is partnering with Pit least a 5K and bikers must ride 10 miles. The best Strava Boss for a Strava art challenge in honor of Beef Month. Strava is a social media app that allows fitness and health enthusiasts to track and share their run, ride or

residents of Kansas or the Kansas City metro area are required to create the outline of a cow using the GPS data from their run or ride, then post it on social media and tag the Kansas Beef Council. Runners must complete at

To enter the challenge, runners or bikers who are

During the next several weeks, U.S. Department of Agriculture's National Agricultural Statistics Service (NASS) will conduct two major mid-year surveys, the June Agricultural Survey and the June Area Survey. The agency will contact producers across Kansas to determine crop acreage and stock levels as of June 1, 2023. "The June Agricultural Survey and the June Area Survey are two of the most important and wellknown surveys NASS conducts," explained NASS' Kansas state statistician, Doug Bounds. "When producers respond to these surveys, they provide essential information that helps determine the expected acreage and sup-

ply of major commodities in the United States for the 2023 crop year. The results are used by farmers and ranchers, USDA, businesses, exporters, researchers, economists, policy-makers, and others who use the survey information in making a wide range of decisions that benefit the producer." Producers can respond to the June Agricultural Survey online at agcounts.usda. gov, by phone, or mail. They will be asked to provide information on planted and harvested acreage, including acreage for biotech crops, and grain stocks. For the June Area Survey, agency representatives will conduct interviews with farm and ranch operators in randomly selected segments of land. in a series of USDA re-Producers will be asked to provide information on crop acreage, grain stocks, livestock inventory, land values, and value of sales. "NASS safeguards the privacy of all respondents by keeping individual information confidential and publishing the data in aggregate form only. This ensures that no operation or producer can be identified," said Bounds. "We recognize this is a hectic time for farmers, but the information they provide is vital in support and promotion of U.S. agriculture. I urge them to respond to these surveys and thank them for their cooperation." NASS will analyze the survey information and publish the results

the ACRE Act would: • Give lenders a strong

incentive to remain in the rural farming and housing markets. thereby boosting local economic activity.

 Offer community banks greater flexibility to work with farmers who may have trouble servicing their debt.

• Exempt from taxation loans secured by agricultural and aquaculture real estate.

 Provide similar relief to interest on loans secured by rural single-family homes that are the borrower's principal residence in towns with populations under 2,500 and below the value of \$750,000.

Assist those seeking to remain on the farm or acquire a home loan in rural communities by providing borrowers with more competitive rates and loan terms.

ICBA looks forward to advocating for the ACRE Act's passage on behalf of rural community bankers and the customers and communities they serve.

Six tips to integrate beef embryos into your dair

calves from dairy farms has steadily increased in recent years, offering farmers a more profitable option than the traditional dairy-beef crossbred or straight-bred dairy calf markets

Driving this trend are:

- · Rising demand for high-quality beef
- · Advances in genetics allowing dairy farmers to produce calves that meet demands for beef production and marketing
- Historically low beef cow inventory

"Beef embryos have huge potential to positively change the economics of a dairy farm by increasing calf value, maximizing return on investment and offering a consistent profit stream in addition to milk production," says Brady Hicks, Simplot Animal Science manager. "However, adopting this reproductive tool oftentimes requires a shift in mindset, employee resources and animal mar-

Use these six considerations to help smooth the way for adopting a beef in dairy program.

1. Use embryos strategically.

Embryos fit well in a strategic breeding program. On average, you can expect to achieve pregnancy rates similar to artificial insemination (A.I.), and sometimes even better. As with A.I., conception and loss rates can vary by farm and production or management systems.

Dairies adopting Herd-Flex® beef embryos report:

- Conception rates similar to those for the herd's A.I. performance
- Higher conception rates during the heat of summer
- Summer embryo conception rates for cows and heifers may increase as much as 15% above a herd's AI performance

Heat-stressed cows often show an improve-

ment in pregnancy rate with embryos over A.I. because the implanted embryo circumvents fertility-related challenges and starts with the placement of an already viable em-

Choose recipients carefully.

Select the correct recipients to increase success. Selecting only first-, second- or third-lactation cows with no more than three services is recommended. Maintain a mandatory 70-day waiting period for dairy cows. Heifers are slightly better recipients than cows. Cows should be in adequate body condition; those with histories of reproductive problems or infertility are not good candidates for use as embryo transfer recipients. Anestrus cows result in much lower conception rates following synchronization.

3. Invest in training. Embryo transfer is an exacting procedure, so

proper technician training and continuing education are essential. A combination of classroom sessions and hands-on training produces the best results.

Embryo transfer can be a more time-consuming process than insemination. Successful programs incorporate embryo transfer as part of their overall dairy management system to help avoid disruption to cows' and people's rou-

4. Choose sires to manage calving ease.

Sire calving ease must be monitored and selected for when making all mating decisions, including the use of embryos.

You can and should analyze embryo sire selection before implantation. Proper pre-fresh cow management can help overcome concerns about calf size at birth. Dairies incorporating beef embryos correctly into their programs achieve birthweights similar to those of dairy breeds.

5. Follow accurate animal ID practices.

Traceability back to the farm gate and early health and nutrition are important distinctions for these calves. These benefits are expected, valued and rewarded by the beef marketing chain.

Dairies are strongly encouraged to manage these full beef calves the same way they do replacement females, using health protocols and managing procedures that are already in place. No additional time or effort is necessary to manage beef calves. Simply identify, feed and care for these calves as you would dairy replacement animals.

Become a price maker, not a price taker.

Carefully consider marketing options and develop a strategic plan to ensure the best sale price for your calves.

For example, local partnerships with restau-

rants or locker beef to end consumers could be a marketing pathway as these cattle possess high genetics and desired carcass/ marbling traits. Marketing day-old calves, weanlings or feeders are further options to consider. Retaining ownership or entering into a marketing agreement with a cattle feeder are additional routes to explore that can lead to larger profits.

Dairies may receive a significant premium for full beef calves versus straight-bred dairy calves. However, these rewards are the result of deliberate marketing plans and the development of trusted relationships within the value chain. Ultimately, the right marketing plan is critical to getting the most out of your beef embryo investment.

To learn more about incorporating beef embryos into your dairy's breeding program, visit HerdFlex.

aquatic plants as the Managing

By Adaven Scronce, diversified agriculture and natural resource agent,

Wildcat Extension District As the weather starts warm up algae and other aquatic plants will become more prevalent in ponds. While aquatic plants are a natural part of the pond ecosystem and vegetation in and around ponds is valuable for fish and wildlife habitat, it can also help reduce stream bank erosion. When aquatic plants become too prevalent and start to overtake a pond they become a problem and are referred to as aquatic weeds. When considering aquatic weed control, remember these two points; prevention is always better than treatment and weeds need to be identified to determine the best option for control. Prevention: Keeping

weeds from becoming a problem is much better than trying to control them once they become established. Reducing fertilizer runoff into your pond and reducing the amount of silt running into your pond are two of the best prevention strategies. The grass is a great sponge for absorbing fertilizers like nitrogen and phosphorus, helping to prevent these chemical elements from running off from surrounding areas and into the pond. Maintaining a grass buffer strip around your pond is a great way to help intercept soil particles and nutrients as they wash off surrounding fields or lawns. It will also help limit sediment washing into your pond, which causes decreased water depth and increased weed

Control: The first step

in controlling aquatic weeds is to properly identify the type of weed that is in the pond. Aquatic weeds are classified into four categories

- floating plants submerged plants
- emersed plants
- marginal plants If you are unsure what type of aquatic weeds are in your pond, you can

bring a sample to your

local Extension Office for identification. When it comes to aquatic weeds there are many options for control. These

· Mechanical and physical control - Pulling, raking or physically removing weeds. This can be a good way to control small quan-

options are described

• Biological - Grass carp are a non-native, plant-eating fish that will reduce the abundance of some aquatic plants. However, grass carp are not the "fix-all" in terms of aquatic plant management because they prefer certain types of plants over others which can limit their usefulness

· Herbicides - There are a number of herbicides that control aquatic weeds, but you must match the correct product with the correct weed. Always read the label for specific rates and application instructions, and follow any restrictions that apply.

When managing a pond, it is important to remember, that prevention and quick action will be the best lines of defense when it comes to controlling aquatic weeds. It is also important to remember that aquatic plants are

part of the natural ecosystem and provide many benefits to surrounding aquatic life.

Seedstock Plus Youth Leaders in Agriculture Scholarship recipients announced

tities.

The American Gelbvieh Junior Association (AGJA) is excited to announce the recipients of the Seedstock Plus Youth Leaders in Agriculture Scholarship. Five individuals are selected to receive the scholarship to assist with travel to The Summit: IGS Youth Leadership Conference. This year's recipients are Annalee Starr. Stapleton, Nebraska: Javcie Forbes, De Smet, South Dakota; Preston Dunn, St. John, Kansas; Isabel Lowe, Adrian, Missouri; and Ian Dunn, St. John, Kansas.

Annalee Starr, Stapleton, Nebraska, is the recipient of the \$1.000 Seedstock Plus Youth Leaders in Agriculture Scholarship. Starr plans to attend the University of Nebraska-Lincoln where she will double major in Agricultural Communications and Animal Science. Starr is thankful for the beef industry knowledge she has gained on her family's ranch in the sandhills of Nebraska but looks forward to learning more about the industry this summer at The Summit in Phoenix, Arizona.

Jaycie Forbes, Preston Dunn, Isabel Lowe and Ian Dunn are the recipients of the \$500 Seedstock Plus Youth Leaders in Agriculture Scholarships.

Jaycie Forbes, De Smet, South Dakota, is currently attending South Dakota State University where she is majoring in Agricultural Communications. Forbes is excited to attend The Summit to develop her leadership skills, meet industry leaders and learn more about agricultural production practices in the southwest United States.

Preston Dunn, St. John, Kansas, is a student at Kansas State University. Dunn credits his passion for raising beef cattle to his spark of wanting to learn more about the industry through attending conferences like The Summit. He not only enjoys building his leadership skills and learning more about the industry, but he capitalizes on the opportunity to grow his network by meeting fellow conference attendees.

Isabel Lowe, Adrian, Missouri, is a student at the Adrian R-III School District and plans to pursue a career as an animal chiropractor and livestock judge. Lowe looks forward to learning more about current issues facing the beef industry and expanding her leadership skills to make her a better advocate for the agricultural industry and the Gelbvieh

Ian Dunn, St. John, Kansas, currently attends St. John-Hudson High School. Dunn is attending The Summit to invest more into his cow herd by learning about new technology in the beef industry, visiting cattle operations, and meeting new friends.

The Summit is an opportunity for juniors to gain industry knowledge and leadership skills that can be used in the future, and is also a place where juniors are able to create new friendships, experience a college campus, and be exposed to current issues affecting the agriculture industry. The Summit will be held July 20-23, 2023, in Phoenix, Arizona.

NCGA supports new legislation that would level the playing field for ethanol

Legislation was introduced in the U.S. House of Representatives that would remove an outdated provision from the Renewable Fuels Standard that prevents corn ethanol from being categorized as an advanced biofuel. The legislation recognizes the progress made in cutting the carbon intensity of ethanol since the RFS was enacted.

The bill, introduced by Rep. Mariannette Miller-Meeks (R-Iowa) and original cosponsors Reps. Nikki Budzinski (D-III.), Eric Sorensen (D-Ill), Wesley Hunt (R-Texas) and Stephanie Bice (R-Okla.).

would also require that the U.S. Environmental Protection Agency use the more modern and accurate Argonne GREET model to assess the carbon reductions from biofuels under the RFS.

National Corn The Growers Association supports the legislation.

"We applaud Rep. Miller-Meeks and the original co-sponsors for introducing legislation that recognizes the declining carbon intensity of today's low-carbon ethanol and helps level the playing field," said NCGA president Tom Haag. "Farmers are proud to contribute

to lowering ethanol's carbon footprint through our production practices, and this bill would ensure EPA uses the most recent science and data to accurately measure the greenhouse gas reduction benefits of biofuels.

Published analysis from the Department of Energy's Argonne National Laboratory concludes corn ethanol's carbon intensity decreased 23 percent from 2005 to 2019 due to increased corn yield. reduced fertilizer intensity and improved ethanol production efficiency, with corn ethanol now between 44 and 52 percent lower in carbon intensity than the gasoline it replaces. Argonne's analysis is consistent with recent research from Environmental Health and Engineering, with contributors from Harvard and Tufts Universities, that corn ethanol today is 46 percent lower in carbon intensity than gasoline, with the potential for further reductions from additional corn feedstock and production process improvements.

Begun in 2005 and expanded in 2007, the RFS requires transportation fuel sold in the United States contain a minimum volume of renewable fuels. Under the law, advanced biofuels must deliver a 50 percent or more reduction in greenhouse gas emissions compared to gasoline, a requirement today's ethanol is capable of meet-

Low-stress cattle handling's domino effect on improved health, productivity and more

most of spring processing efforts this year?

"Low-stress handling presents a domino effect. By minimizing handling stress, you will see improvements in immune response, eating and producing. Calves go back to eating and gaining weight. Cows go back to eating and growing their calf. And. cattle respond better to vaccines," says Julia Herman, beef cattle specialist veterinarian with the National Cattlemen's Beef Association (NCBA).

Defining Low-stress Handling

For anyone unfamiliar with the term and practice, "Low-stress handling is one part of stockmanship that incorporates the understanding of cattle's natural behaviors and the handler using that knowledge to positively affect cattle movement and management. It's responding to their movement, anticipating what the animal will do next," says Dr. Herman. The Beef Quality Assurance (BQA) program teaches about this principle in preventing stress and disease in cattle, which improves cattle welfare and productivity.

While the practice of excellent stockmanship may have been brought more to the forefront in recent years, the skills are something that have, often, been passed down through generations of family ranches.

Dr. Herman remembers watching her husband and his dad work cattle years ago. "It was like magic," she said.

without making a sound. I think there are families where this level of stockmanship has been passed down from generation to generation, and it's taken a couple of high-profile people, like Temple Grandin and Bud Williams, to really bring low-stress handling and stockmanship to the forefront. They have been really good champions of that type of handling."

The Benefits of **Practicing It**

When we are stressed, we're more likely to succumb to a cold or change in behavior. The same rings true for cattle - they can experience health implications and even become moody - and the impacts can stem gener-

Tony Hawkins, Valley Vet Supply technical services veterinarian, shared how, "Anything we could do to minimize stress in these animals is good one, because of animal husbandry and two, because it will actually improve their response to vaccines. Low-stress handling is good for you, and it's good for them.'

Long thought to be true, science has confirmed how cattle handling directly affects cattle behavior, in addition to health.

Interestingly, stress handling methods impact mothering behavior of today, plus the growth and behavior of her future offspring. Dr. Herman explained more. saying "We're learning more about mothering behavior and how minimizing stress, such as practicing low-stress handling with the dam, in addition to her genetics, can impact multiple generations of animals. That's because stress hormones circulate throughout the blood system. If you're following good stockmanship, the heifer will have a better attitude and be calmer in stressful situations. and that can follow down lines. Good-behavior cows can pass that behavior on to multiple generations. I think people have known that, but we're finally getting scientific proof of

Three Tips to **Implement When Working Cattle**

1. Take advantage of their flight zones to move cattle. Picture an imaginary oval around a single animal; your placement encourages them to start or stop movement. Dr. Herman explained more, saving, "When you enter the animal's (or group's) flight zone, it encourages forward movement When you retreat from the flight zone, it signals the animal to stop moving. These concepts can be used whether vou are handling cattle on foot, horseback, in a vehicle, or when the cattle are in a chute. If we provide good directions to handlers and the cattle through low-stress handling, we improve how the animals respond during handling events."

2. When working cattle and you see a hiccup, it's okay to pause, take a minute and investigate. If you notice cattle are no longer moving smoothly through a specific part of the facility, pause and investigate the holdup. Dr. Hawkins stressed that, "Really importantly, producers need to think about the design of their facility, and overall quality of the facility, because that plays a big role in how these animals move.'

Prioritize training, and have the right people for the right job. Dr. Herman says, "I think that a huge thing is making sure that our people are trained in the jobs that we are expecting them to do. Stockmanship training creates confidence in our caretakers

ty around cattle. Also, it's important to be open to changing roles of people during processing events, so that they feel more comfortable and effective. Maybe someone is pushing cows but would rather give vaccines, or vice versa. And when they get tired, maybe we need to switch people out every couple of hours." This will improve the human's experience which will also improve the cattle's

experience. At the end of the day, Dr. Herman asks, "What can the producer control? They can control the products they're using, the facility they're running animals through, and are handling the animals going through it - all to set that cow or calf up for a positive experience and the most productive life possible."

Education, resources and training are easily accessible for producers, to help further steward the industry we're all passionate about.

"There's a lot of training available online that covers stockmanship, cattle health and more, and I would recommend that everybody take advantage of that. It's free and available at BQA.org," says Dr Hawkins.

To help ensure your herd's health and more, visit ValleyVet.com.

Horse-Eye View

Temple Grandin, the outstanding animal scientist and animal behaviorist, has built an entire career based on the con-

cept of seeing the world as critters see it. In doing so, she has added immensely to the improvement of livestock facilities and the

Paul Revere's Horse

(with apologies to Henry Wadsworth Longfellow) By Ron Wilson, Poet Lariat

Listen, my children, and you shall hear, The other side of the story of Paul Revere. He made American history in 1775, For alerting the people that invaders would arrive. He gets credit for warning the countryside, But I was the horse who gave him that ride. It's not really fair. He gets all the praise, While I barely got a pasture to graze. This happened in the time immediately before The event humans call the Revolutionary War. The American colonists

were overtaxed and mistreated, But the British king wanted resistance defeated. He sent a Redcoat army across the ocean tide. To put down revolution on the American side. This fella Revere was part of the groups That were keeping an eye on the invading troops. I was just in my stable, hipshot, eating hay,

When it turned out I would be needed that day. They had me all saddled when midnight came `round.

When Revere saw the signal, he mounted up with a bound. The American spirit would not be succumbing, As he rode along shouting, "The British are coming!

By warning the people, he helped build a new nation, As it gained independence from foreign domination. They even wrote a poem to celebrate his deed,

But what about me, his reliable steed? The poet Longfellow honored Paul Revere, of course, But Paul couldn't have done it without me,

the horse.

That's sure how it seems, as someone has said it: The horse does the work, but the rider gets the credit.

Happy Trails!

benefit of low-stress cattle handling. Many equine clinicians have also incorporated this concept into their approaches to natural horsemanship.

It's a paradigm shift. It means seeing the world through the animal's eyes, rather than my human-centric ones.

In the old days, I would cuss that cow who doubles back in my sorting pens (Okay, maybe I still do). But now I understand that the design of the pens themselves can make a difference. Rather than triggering a cow's natural flight instincts, the pens can be built in such a way as to contribute to the positive movement of the critters. These are things taught in Beef Quality Assurance classes, such as

the importance of consistent lighting, good footing, or solid curved panels.

It is a similar situation with horses. Rather than get frustrated with a horse's contrary behavior, I can come to understand that something is triggering his natural instincts to behave in a certain way. If I can figure out a way to use his natural instincts in my favor, rather than against my wishes, it's a big benefit.

I'm not happy when my horse spooks while I'm riding and a plastic bag suddenly blows by, but if I understand that he is a prey animal who is sensitive to sudden movement, it makes more sense to me Seeing the world through a horse's eye and mind can make a big difference.

We tend to ignore the horse's perspective. Some years ago, the comedian (and talented bluegrass banjo picker) Steve Martin wrote a song about the Midnight Ride of Paul Revere from the perspective of Revere's horse. That's a different take on a famous historical event.

Paul Revere was a silversmith in the American colonies before the Revolutionary War of 1776. The colonists sought to rebel against the British crown's burdensome rules and taxation, so the British king sent an army of troops to put down any rebellion. Paul Revere and others took on the task of warning the American colonists when the British troops made their move. When

the Redcoats started to advance, signal lanterns were flashed in the tower of the old North Church and Paul Revere mounted up and rode out to spread the word that the British were coming.

Paul Revere's ride became famous thanks to a classic poem written by Henry Wadsworth Longfellow, but almost nobody knows that Brown Beauty was the horse who gave him the heroic ride. It wouldn't have happened without the horse but the human had the better press agent. All this inspired the following poem.

Thanks to Temple Grandin (and even Steve Martin) for helping us see life through the eyes of our livestock.

Gene-edited calf may reduce reliance on antimicrobials against cattle disease

Cattle worldwide face major health threats from a highly infectious viral disease that decades of vaccinations and other precautions have failed to contain. Federal, private-sector and Husker scientists are collaborating on a new line of defense, by producing a gene-edited calf resistant to the virus.

If follow-up research confirms its efficacy, the gene-editing approach offers long-term potential to reduce antimicrobial and antibiotic use in the cattle industry.

The bovine viral diarrhea virus devastates the bovine immune system and can cause severe respiratory and intestinal harm to infected beef and dairy cattle, said veterinary epidemiologist Brian Vander Ley, an associate professor in the University of Nebraska-Lincoln's School of Veterinary Medicine and

In utero calves are especially vulnerable to infection. If they survive, they can remain infected for life, repeatedly spreading the virus to other cat-

"They show up as normal cattle but really, they're shedding a tremendous amount of virus. They're the 'Typhoid Marys' of BVDV spread," said Vander Ley, assistant director of UNL's Great Plains Veterinary Educational Center in Clav Cen-

The cattle industry has vaccinated against the disease since the 1960s, but "the highly mutable nature of BVDV and the emergence of highly virulent strains of BVDV contribute to limited success of present control programs," the Academy of Veterinary Consultants has stated.

Scientists identified the

specific genetic structure associated with the disease earlier this century. A collaborative project involving scientists with the USDA's Agricultural Research Service and Acceligen, a Minnesota-based private company, used gene editing to change the small number of amino acids that lead to BVDV vulnerability, while keeping the rest of the protein, CD46, unchanged.

"Our objective was to use gene-editing technology to slightly alter CD46 so it wouldn't bind the virus yet would retain all its normal bovine functions." said Aspen Workman, a scientist with ARS' U.S. Meat Animal Research Center in Clay Center, Nebraska.

A gene-edited calf, named Ginger, was born on July 19, 2021, and transported to UNL a week later for close monitoring by Vander Ley. Throughout, Ginger has remained a "bright, healthy calf," normal both physically and behaviorally, which included a week with a BVDV-infected dairy calf that was shedding the virus in great volume.

The research findings were published online May 9 by the PNAS Nexus open-access journal, a sibling publication to the Proceedings of the National Academy of Sciences. Workman is lead author.

Ginger is a Gir. a tropically adapted cattle breed cattle in North America. Follow-up research will require experimental replication in other cattle breeds. Ginger also will be monitored through pregnancy, if it occurs.

If the gene-editing approach proves viable, it could potentially reduce the cattle sector's use of antimicrobials, Vander Ley said.

"The most successful version of the future that I can see is one where we don't have to deal with antimicrobial resistance because we just don't use that many antimicrobials," he said. "That's better for everyone. That means that we have eliminated the cause of a lot of the antimicrobial use and we've eliminated that expense for livestock producers."

Michael Heaton, a US-MARC researcher for the BVDV project, concurred. This line of research "represents another opportunity to lessen the need for antibiotics in agriculture," he said.

In addition to Vander Ley, Workman and Heaton, other study coauthors are Erin E. Jobman, Great Plains Veterinary Educational Center; Gregory P. Harhay, USMARC; private-sector scientists Tad S. Sonstegard, Dennis A. Webster, Luke Sherry, Sabreena Larson, Daniel F. Carlson and Jonathan Bostrom; and Theodore S. Kalbfleisch with the University of Kentucky.

"When you look at the

Against a backdrop of American flags suspended from multihued combines, U.S. Representative Tracey Mann (KS-01) sat down with U.S. House Agriculture Committee Chairman Glenn 'GT' Thompson (PA-15) on May 2 to gather input on Farm Bill priorities during a food and agriculture listening ses-

The session marks the first official Farm Bill listening session since a Senate field hearing in 2017 and follows a late April roundtable discussion with Kansas Senator Roger Marshall and U.S. Senator John Boozman, the ranking member of the U.S. Senate Committee on Agriculture, Nutrition, and Forestry. The current version of the Farm Bill expires on September 30. 2023, so these sessions are part of many others happening across the country as lawmakers negotiate the future of the Farm Bill.

"We are all here because we care about agriculture, with getting ag policy right," Mann said. "And we want to see Kansas and American farmers, ranchers and producers thrive. That's why we planned this session to listen, share and make this Farm Bill the strongest one in American history. For that to happen, we must come together with our diverse perspectives and find points of unity."

Conducting this listening session within the Big First congressional district was a barometer of the needs of U.S. agriculture. Inside the Saline County machine shed of Justin Knopf – immediate

past president of the Kansas Association of Wheat Growers - farmers, ranchers, agricultural producers, and leaders in Kansas agriculture gathered to emphasize the importance of Farm Bill programs from crop insurance to food aid and everything in

between. "I'm just incredibly grateful that they took the time to come out and spend time listening in our community, in front of a wheat field, in front of harvesters," Knopf said. "What was important for me was for them to experience the sense of community here, the good people that I partner with on a daily basis in our operation - my neighbors, bankers, crop insurance agents, USDA staff and other business people in the community. I wanted them to have a sense of how this legislation impacts all those individuals and our ability to get our job done and done well."

Extreme drought illustrates importance of crop insurance

With a wheat field just behind the flatbed trailer serving as the stage, Knopf used his welcome to walk the lawmakers and attendees through the current growth stage of his wheat crop and his expectations for a below-average yield. He recognized his wheat is in better shape than many and pointed out that thousands of Kansas wheat acres have been abandoned or will not be harvested this year due to extreme drought conditions. The persistent drought also emphasizes the importance for crop insurance, which was repeated by several commentators grassroots resolution. The

throughout the morning session.

"Farmers deal with a lot of risk; it's an inherent part of our business and what our families deal with," Knopf said. "Crop insurance is probably the most important and most fundamental way that we have to manage some of that risk in extreme weather events, be it drought like we're experiencing currently or floods like they recently experienced in California.'

"We heard a lot of that message today from the farmers who spoke up and made comments on crop insurance. In the wake of a disaster, crop insurance is what allows us to have the means to put in next year's crop.'

Session highlights Kansas ties to food aid

Attendees also expressed support for other Farm Bill programs, including food aid assistance programs like USAID Food for Peace, which can trace their origins to the ideas of a young Kansas farmer. In September 1953, Peter O'Brien, a farmer and rancher from Chevenne County, suggested at his county Farm Bureau meeting that Kansas farmers could give some surplus grain to countries in dire need - saving lives and building goodwill all at once. A resolution was drafted at the county level and was adopted by the Kansas Farm Bureau and the American Farm Bureau Federation.

In 1954, U.S. senator Andy Schoeppel, also from Kansas, sponsored the Agricultural Trade Development and Assistance Act, a bill based on the act was then signed into law by President Dwight D. Eisenhower. The law became the basis for today's modern food aid programs. The United States now sends more food aid to countries in need than any other nation and more wheat is used in the United States as in-kind aid than any other commodity.

Wheat is not only donated for direct use but is also a popular commodity for monetization. a development program where donated commodities are sold within the recipient country, and the proceeds support agricultural development projects. In his comments, Ken Wood, board member for the National Wheat Foundation and retired farmer from nearby Chapman, emphasized the need to keep wheat as a commodity donation, rather than switching the programs to relying on monetary assistance.

Mann and Thompson each echoed their support for food aid programs in the Farm Bill during their remarks.

itive impact on families around the world," Thompson said. "As I like to say, people with full bellies are less likely to engage in war and terrorism. And so that makes all of you and that makes the American farmer a champion for world peace."

Lawmakers commit to strengthening export market development programs

Both lawmakers also expressed their commitment to increased funding for the Farm Bill-authorized export market development programs

culture Export Promotion Act (H.R. 648), which is currently making its way through the U.S. political process, along with the Senate equivalent - the Expanding Agricultural "This is having a pos-Exports Act (S. 176). "Congressman Mann has led strongly and sponsored legislation to double MAP and FMD funding." Knopf said. "I applaud his efforts on that front and

> Rural input helps shape farm bill priorities

Chairman Thompson fol-

lowing suit in supporting

that push because the re-

turn on investment is very

high."

The stated and submitted comments on export market development, food aid, crop insurance and many other topics will travel from the machine shed in Saline County to

session the marble halls of Wash ington, D.C. There, they'll be combined with the comments from other listening sessions across the country to help shape the next Farm Bill. While timing and details are still being determined, one fact is certain -- lawmakers are listening to what U.S. producers need to continue doing what they do best - providing food, fuel and

fiber for the world. "Agriculture inspires us to look back at our shared heritage, engage in the present and plan for the future," Mann said. "That's what today is about - planning for the future. Producers do everything they can to pass the tradition of agriculture on to their children. And we have conversations like this one today to make sure that we're able to do that."

Following the listening session, Mann, Thompson, and the Farm Journal Foundation held a panel discussion titled. "The Role of Innovation in Global Food Systems" at Kansas State University. Additional panelists included Dr. J. Ernest Minton, Dean of K-State College of Agriculture; Gregg Doud, vice president of global situational awareness and chief economist of Aimpoint Research; and Tyler Lund, Farm Journal Foundation farmer ambassador.

protocols Estrus synchronization and AI

By Ross Mosteller, Meadowlark District Extension Agent, **Livestock & Natural**

Resources One of the most important sets of dates have been placed on my spring calendar. You might think it is my kid's birthdays, or my twentieth wedding anniversary (all very important dates that my family might say I don't pay attention to!) but what I'm discussing today are the dates for estrus synchronization for my spring calving cow herd. Regardless of when calving season occurs in your operation, the use synchronization proto cols can result in shorter breeding and calving seasons, which research shows time and time again to have major impacts on cow herd profitability.

More calves born earlier in the calving season result in a more uniform, heavier, consistent sized calf crop at weaning. Other management benefits can include: grouping cows by gestation group for marketing, calving or nutritional management, better use of vaccination timing and quantities, having replacement females of a more uniform maturity at breeding next year, all in addition to the obvious larger groups of more uniform-sized calves.

The Beef Reproduction Task Force has released some updated estrus synchronization protocols for heifers and cows, including sexed semen protocols - as that technology is becoming more common place in all phases of both the beef and dairy industries. These protocols can be found in most of the major semen supply company websites, apps and/or catalogs and at many University websites as well. Each year it seems more options become available to producers, which is both beneficial and possibly confusing at the same

Estrus synchronization can be used for natural mating or breeding by artificial Insemination (AI). synchronization protocols permit managers to concentrate the labor needed for heat detection, and in some cases eliminate the need for heat detection due to the success of timed-AI systems. Estrus synchronization systems vary in cost, labor required, and effectiveness on various classes of livestock. If you've never used estrus synchronization or are looking at a different system, you need to visit with folks more familiar with their use and consider the following questions to help decide what works best for your situation.

Do you have facilities to handle multiple trips through a chute? Do you have adequate labor and/ or time to invest? If using AI, is a technician available or are you able to learn the process? Are you willing to invest in some

Every Thursday

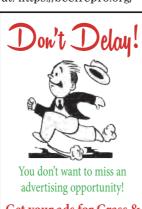

at 12 Noon

1180 US Hwy. 77, P.O. Box 67,

up-front cost for a protocol and do you feel there will be return on this investment? Do you have a specific purpose for AI and synch protocols, such as use of superior sires, goals for all male or female calves with sexed semen, specifically designed crossbreeding systems, etc... These are just a few of the things to consider, but thought needs to be given before jumping into this management approach.

Generally speaking, the use of AI permits more cows to get bred to genetically superior sires for traits of economic impor tance related to your operation's production and marketing goals. if not utilizing AI, there is benefit to having more first heat cycles in the first third to half of the breeding season, with return heats being more uniform and synchronized as well. This can mean more bull power is required with a natural service approach. Having breeding and calving "waves" does have appeal for some, compared to a two month (or whatever your planned calving season length is) stretch of intense daily observation.

Maintaining 60-to-75-day breeding and calving season can be one of the most important management tools for cow calf producers. Estrus synchronization can be the tool to get cows settled as early in the breeding season as possible and get cows bred to bulls with highest possible genetic value. A wealth of information on this topic, including free protocol decision tools can be accessed at: https://beefrepro.org/

Schwieterman Market Outlook

A marketing commentary by Bret Crotts

After a promising start to the week, especially for the wheat market, the tides turned and the bears controlled most of the action. The combination of some rain in the HRW Belt, the Russians and Ukrainians keeping the Black Sea open, no problems with planting, and a general lack of big export sales, gave the bears all the ammunition they needed to pressure the markets.

There was nothing supportive in the May supply and demand report for the corn market, so it was a little surprising that the market started the week as well as it did. Once the wheat was no longer lending any support, there wasn't much for the corn

bulls to stand on. Since the corn is trading back where we were in October and November of 2021, hopefully we attract some demand. Judging by the cancellations by the Chinese, we may not have much hope at all sending them corn.

A weather scare would work to support both the corn and soybeans, but no one is concerned about the weather. It has been dry enough through the Corn Belt to allow for a good planting pace, and there are some areas that do show up on the Drought Monitor, but I doubt that anyone gets excited about a weather market until after Memorial Day.

After reaching the highest level since mid-November last Wednesday, the July KW dropped 97 ½ cents by Friday afternoon. Keeping the Black Sea Corridor open definitely crushed some bullish hopes again, and rain does make grain, so some of the pressure does make sense. One, however, would think that the Wheat Quality Council's report could have provided some support. It will be the smallest wheat crop since the late 1950's, but most people already know that, and demand isn't good enough for supply problems to matter. Harvest will be terrible, but the next thing on the list is "harvest pressure," so be prepared.

Soybeans and soybean oil felt like they were just in freefall mode. There just wasn't much positive activity. The export front is quiet, and we don't have any fears about the weather. It is the same old thing on repeat, over, and over again. We need to see better demand to give these markets some life. We have to start thinking about the possibility of the November soybeans moving below \$11.

Cattle had a pretty good week. The deferred live cattle contracts made new highs, as did most of the feeder cattle contracts. The cattle on feed num-

bers came out as expected with 97% on feed, 96% placements, and 90% marketed. The report won't have much direct market impact, but it will serve to reinforce the bullish fundamentals we are working with. Be very cautious trying to pick a top in the cattle market. Think about using options for price protection because we never know when we may have a bearish surprise, but we also have no idea how high "too high" is.
